

CurePharm: AI-Powered Healthcare for Smarter Patient Care

ARKAPRABHO SAHA

Future Institute of Engineering and Management

-----***-----

CurePharm is an AI-powered healthcare website designed to make medical services more accessible, organized, and user-friendly. In a world where people expect quick information and convenient digital services, CurePharm brings healthcare support into one smart platform.

The website can help users find health information, manage appointments, and interact with medical services more efficiently. By using artificial intelligence, CurePharm can reduce repetitive tasks, improve speed, and create a smoother experience for both patients and healthcare providers.

One of the main strengths of CurePharm is automation. Smart features can support symptom guidance, patient record management, appointment booking, and personalized recommendations. These functions can save time, reduce workload, and make healthcare access easier for users.

CurePharm also represents the future of digital healthcare. Instead of being only a static information source, it can become an intelligent system that responds to user needs and provides relevant support. This makes healthcare more practical, modern, and approachable.

At the same time, responsibility is important. Healthcare platforms must protect privacy, ensure accuracy, and use AI carefully. Technology should support doctors and patients, not replace medical judgment. When designed well, CurePharm can become a strong example of how AI can improve healthcare access and efficiency.
